

The first part of the paper is devoted to a general survey of the progress of the science of the mind in the last century. It is shown that the science of the mind has been divided into two main branches, the science of the faculties and the science of the affections. The science of the faculties has been the more important of the two, and has been the more successful. It has been the science of the faculties which has been the most fruitful in its results, and which has been the most useful to the world. It has been the science of the faculties which has been the most successful in its efforts to discover the laws of the mind, and which has been the most successful in its efforts to apply these laws to the improvement of the human mind.

The second part of the paper is devoted to a more detailed examination of the science of the faculties. It is shown that the science of the faculties has been divided into three main branches, the science of the senses, the science of the intellect, and the science of the will. The science of the senses has been the most important of the three, and has been the most successful. It has been the science of the senses which has been the most fruitful in its results, and which has been the most useful to the world. It has been the science of the senses which has been the most successful in its efforts to discover the laws of the mind, and which has been the most successful in its efforts to apply these laws to the improvement of the human mind.
